Speed Camera Warning System

Palm OS

TrafCam is a software package that runs on PDAs that use the Palm operating system. It takes your position from a connected GPS receiver, compares it to our database of speed camera locations, and provides audible and visual warning as you approach a camera location.

The easy-to-read warning screen shows the direction and distance to the camera, the type of camera, and your current road speed. For a growing number of cameras, it also shows the direction that the camera points, and the prevailing speed limit for the camera. A sound is made to attract your attention.

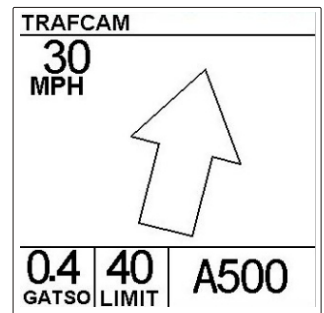

## Key Features:

- ✓ Comprehensive yet easy-to-read warning display
- ✓ Warning range user-selectable, based on distance or time
- ✓ Frequent camera location database updates downloaded from our web site
- ✓ We'll send you an email when a new database is ready - no need to keep checking
- ✓ "Speed Warning" feature can be set to warn you as you exceed a chosen speed, even if no camera is in range
- ✓ Compatible with most Palm OS devices, including those from Palm, Handspring, Garmin and more
- ✓ Compatible with most GPS receivers: hard-wired, Bluetooth, clip-on and built-in devices

When you get within range of a speed camera, the screen shows the direction and distance to camera. On this warning it also shows the speed limit at the camera, and the road that the camera is on.

The screen always shows current GPS speed, whether there is a camera warning or not.

TrafCam runs on a wide range of Palm OS devices, including those from Palm, Garmin and Handspring.
